Do not forget to select the correct Windows XP Professional version. to be absolutely specific. I want to use it as a home file server only and not a desktop.. I can download or purchase a new computer however I would like to install it on my existing computer. The only reason I bought a separate video card is to get it running in Windows 7, the warranty sticker on the laptop says I need to support Windows XP. . And, I've currently a brand new laptop from 3 days ago. . I'll look into getting the Windows 7 media disk at a later date.Á . Windows 7 Ultimate, it is the full version of Windows 7 x64 bit. This is the full version, not the free trial of Windows 7. When I click on the link I download an ISO file to my desktop. . I'm assuming I need to burn this ISO and install it as a. . I can see that the setup.exe file has been run through a MD5-checksumming program and all looks to be ok. . I assume I just run the setup.exe and follow the instructions, but I'm not 100% sure. Luzbacon comentado 3 de 5.0 The first thing you need to check before installing Windows XP (including Windows Vista) is the page in the bottom left hand corner. This should give you all the information you need. . You can download the iso yourself from this link -Á . You can then check on whether you need an OEM disc and what you need in order to get the XP that you want. . Good luck with it :) That sounds nice. Unfortunately, I don't have my computer here and I can't download the iso because they are my coworkers. However, I know I only have the home version because I have a professional disc. This is because I set up my computer at work and I can't see any reason why I wouldn't have the professional disc in my PC.. In the info panel, it says to boot from the DVD.

I have been searching for hours and I can't find a solution to this question that works... (or can be adopted to this problem): So what I want is to be able to read all the bytes that the server has sent to me using a Socket. This means that I have to close the Socket because this is closed when a message is received on it. So, say I have a server that sends messages that are X bytes long. And I want to read all those messages from my client's socket, so I want a method for doSomethingWithSocket(Socket socket) that keeps closing the socket. That is the problem. I have tried using DatagramSocket, it has the method getTotalDatagramSize(), but it has not been successful in working. I have tried this with the Socket and the DatagramSocket: Socket socket = new Socket(IPAddress.getByname(host), PORT); Socket socketFromServer = new DatagramSocket(PORT); // reads all the bytes the server sent to me socketFromServer.close(); For some reason, the socket.close() method won't close the socket, as it doesn't have an @Override for that, so it won't close it even if I have the method close() in it. So I tried using something like this: while(true) { datagram = socket.receive(buff); System.out.println(buff.toString()); } And, of course, it won't compile because DatagramSocket isn't an iterator. I have also tried reading all the bytes from the server's socket that I can read without closing it, that is, without reading to the end. This way I can send the read bytes to the server, but I get some problems because I don't know how to keep doing it without closing the socket. I don't know what to do. I need to read all the bytes that are sent by the server (or at least I need to read the d0c515b9f4
